(54) Perfume compositions

(57) The composition contains a substance:

where R_9 is C_9 - C_{11} straight-chain alkyl, R_{10} is methyl and X is

OI

a compound:

where R₁₂-R₁₅ are hydrogen or C₁-C₄ alkyl; a compound:

$$R_{5}$$
 R_{4}
 R_{2}
 R_{3}

where R₁ to R₅ are hydrogen or C₁-C₄ alkyl; a compound:

where R_7 is C_{11} , C_{13} , or C_{15} alkyl and R_8 is C_1 - C_3 alkyl; and a compound;

where n is 8 to 28;

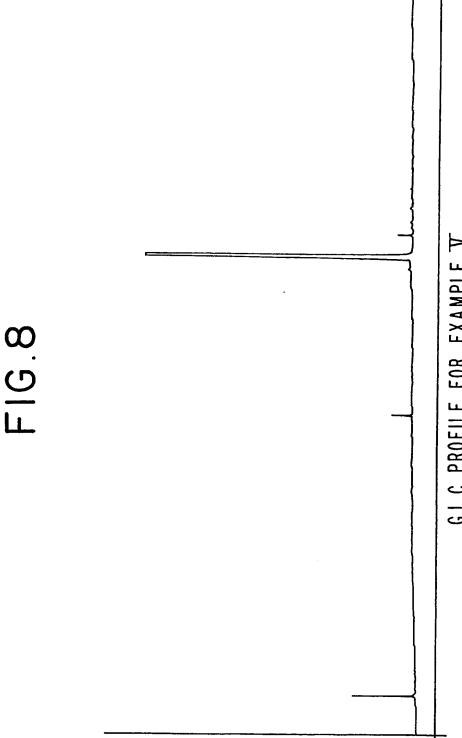

FIG.6 B

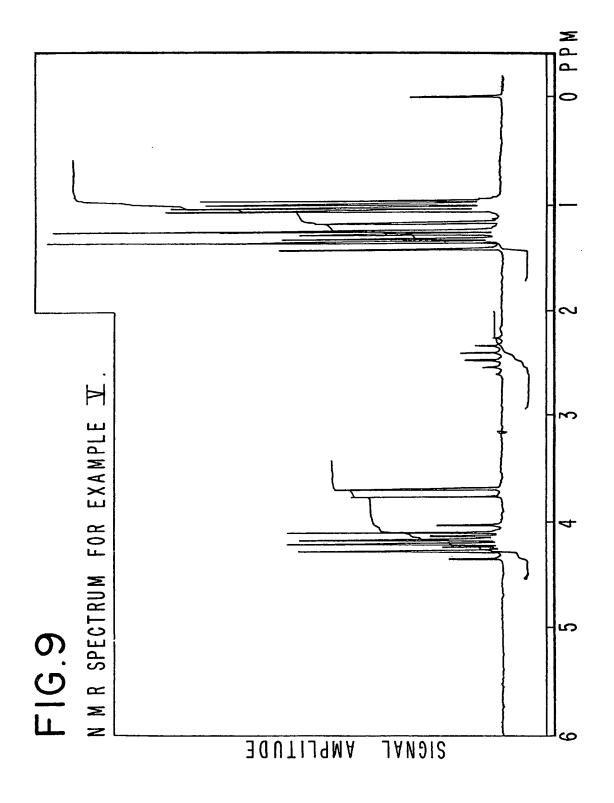

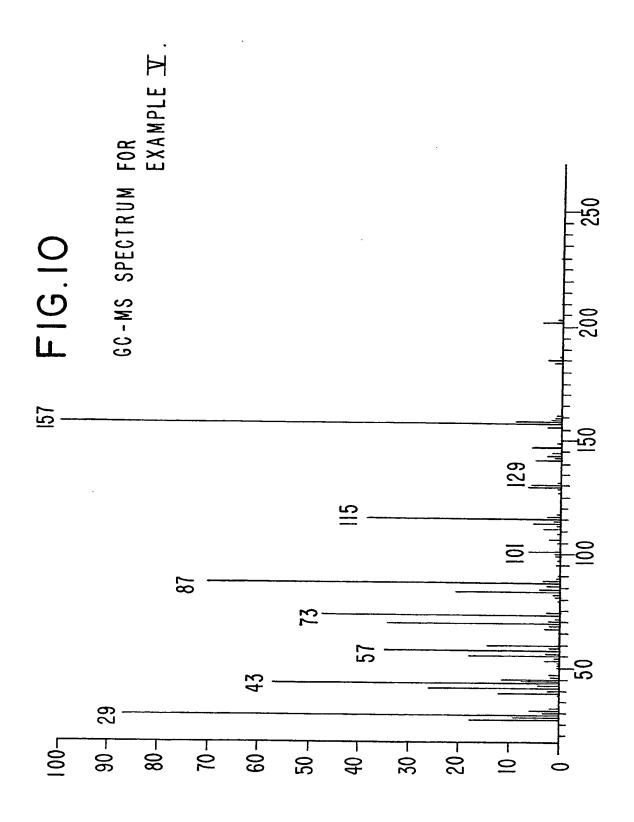

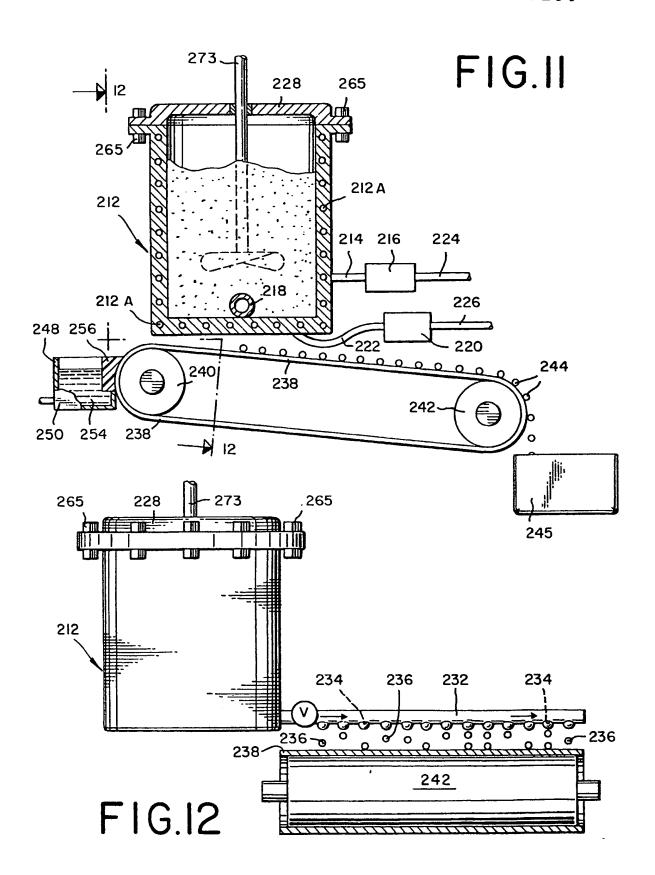

SPECIFICATION

Perfumery mixture

5 The present invention provides a mixture of compounds covered by the genus: "A": At least one substance having the structure

5

X Ro

10

15

in an amount of from about 1% up to about 5% wherein R_9 represents C_9 - C_{11} straight-chain alkyl and wherein R_{10} represents methyl and X is a moiety selected from the group consisting of:

15

10

$$\left\{\begin{matrix} c \\ 0 \\ 0 \end{matrix}\right\}$$

and

20

20 "B": At least one compound having the structure:

. 25

25

30 in an amount of from about 3 up to about 7% wherein each of R₁₂-R₁₅ represents hydrogen or C₁-C₄ alkyl with the proviso that at least two of R₁₂-R₁₅ represents hydrogen;

"C": At least one compound having the structure:

35

40

35

in an amount of from about 2% up to about 6% wherein R_1 , R_2 , R_3 , R_4 and R_5 each represents hydrogen or C_1 - C_4 alkyl with the proviso that one, two or three of R_1 , R_2 , R_3 , R_4 and R_5 represents C_1 - C_4 alkyl;

45 "D": Optionally, at least one compound having the structure:

45

40

50

50

in an amount of from 0% upn to about 1.2% wherein R_6 represents hydrogen or methyl and R_{11} represents 55 hydrogen or methyl with the proviso that at least one of R_6 or R_{11} is hydrogen;

"E": At least one compound defined according to the structure:

55

60

$$\begin{array}{c}
O \\
R_7
\end{array}$$

$$O - R_8$$
60

in an amount of from about 30% up to about 70% wherein R_7 represents C_{11} , C_{13} , or C_{15} straight-chain alkyl and R_8 represents C_1 - C_3 lower alkyl;

35

40

5

15

"F": At least one compound having the structure:

in an amount of from about 20% up to about 60% wherein n represents an integer of from 8 up to 28; "G": Optionally, the compound having the structure:

in an amount of from 0 up to about 6%; and "H": Optionally, the compound having the structure:

30 in an amount of from 0 up to about 6% with the requirement that:

$$\Sigma[A+B+C+D+E+F+G+H]$$

35 equal 100%. This mixture is hereinafter referred to as "The Leather Key Fragrance Mixture".

The leather key fragrance mixture is capable of augmenting, enhancing or imparting leathery aromas with spicy, ambery, caryophyllene-like, animalic, fruity, woody, ionone-like, sweet, vanillin-like, coconut, woody, orris, thyme-like and floral undertones and spicy, smooth leathery, oriental and sweet topnotes to perfume compositions, perfumed polymers (useful, for example, in synthetic leathers), perfumed articles (e.g., solid 40 or liquid anionic, cationic, nonionic or zwitter ionic detergents, fabric softener compositions, fabric softener articles, hair preparations, cosmetic powders and the like) and colognes.

Preferred members of the genus defined according to the structure:

45
$$R_{5} \longrightarrow R_{1}$$

$$R_{4} \longrightarrow R_{2}$$

$$R_{3} \longrightarrow R_{3}$$

$$R_{5} \longrightarrow R_{1}$$

$$R_{2} \longrightarrow R_{2}$$

wherein R_1 , R_2 , R_3 , R_4 and R_5 each represents hydrogen or C_1 - C_4 alkyl with the proviso that one, two or three of $R_1,\,R_2,\,R_3,\,R_4$ and R_5 represents $C_1\text{-}C_4$ alkyl are as follows:

TABLE I

| | COMPOUND | PERFUMERY PROPERTY | |
|----|--|--|----|
| 5 | 3-t-butylphenol | A leathery, spicy, ambery aroma | 5 |
| | 2,6-diisopropyl phenol | A spicy, leathery aroma | |
| 10 | 2,3-dimethyl phenol | A leathery, carophyllene-like, animalic, spicy aroma. | 10 |
| 15 | 2,3,6-trimethyl phenol | A leathery, fruity, woody β-ionone-like aroma with spicy and smooth leathery topnotes. | 15 |
| 20 | 2,5-dimethyl phenol | An animalic (tonquin musk-like), sweet, vanilla, spicy and coconut aroma profile. | 20 |
| | 2-t-butylphenol | A leathery, animalic and smoky aroma with oriental, sweet and spicy topnotes. | |
| 25 | . 4-(2'butyl) phenol | A spicy, leathery aroma. | 25 |
| | 2-n-propyl phenol | A balsamic, smoky aroma. | |
| 20 | 3,5-dimethyl phenol | A woody, orris aroma. | |
| 30 | 2,3,5-trimethyl phenol | A leathery, sweet, vanilla aroma. | 30 |
| | 3,5-diisopropyl phenol | A spicy, thyme-like aroma. | |
| 35 | 2,6-di-t-butylphenol | A leathery, woody, spicy aroma. | 35 |
| | 2,4,6-trimethyl phenol | A leathery, woody, floral and spicy aroma profile. | |
| 40 | 2-methyl-4-t-butylphenol | A leathery, spicy, woody and floral (jasmin) aroma with spicy, leathery topnotes | 40 |
| | 3-isopropyl phenol | An animalic, leathery aroma. | |
| 45 | Examples of the compounds defined according to t | he structures: | 45 |
| 50 | | R ₁₁ R ₆ | 50 |

wherein R_6 represents hydrogen or methyl and R_{11} represents hydrogen or methyl with the proviso that at 55 least one of R_6 or R_{11} is hydrogen are:

Naphthalene;

1-Methyl naphthalene; and

2-Methyl naphthalene.

Examples of the compounds having the generic structure:

$$R_{r} = \begin{pmatrix} 0 \\ 0 - R_{a} \end{pmatrix}$$

wherein R_7 represents C_{11} , C_{13} or C_{15} straight-chain alkyl and R_8 represents C_1 - C_3 lower alkyl are: Isopropyl myristate: Methyl laurate; Methyl myristate; and 5 Methyl palmitate. Examples of the compounds having the generic structure: 10 10 wherein n represents an integer of from 8 up to 28 are: n-Decane; n-Undecane; 15 n-Tridecane; n-Tetradecane; n-Pentadecane; n-Hexadecane; n-Heptadecane; 20 n-Octadecane; n-Nonadecane; Eicosane; Heneicosane' Docosane; and 25 Tricosane. 25 Examples of the compound having the generic structure: 30 30 wherein R_9 represents C_9C_{11} alkyl and R_{10} is methyl are: Methyl nonyl ketone; 2-Tridecanone; and 35 2-Tridecanol. Examples of compounds having the generic structure: 40 40 45 wherein R_{12} , R_{13} , R_{14} and R_{15} each represents hydrogen or C_1 - C_4 lower alkyl with the proviso that at least two of $R_{12},\,R_{13},\,R_{14}$ and R_{15} represents hydrogen are as follows: Xylene; Diethyl benzenes; 50 1,2,4-Trimethyl benzene; 1,2,3-Trimethyl benzene; Mesitylene; and 4-t-Butyl toluene. The compound having the structure:

has an execellent, long-lasting leathery, ylang aroma with sweet floral topnotes. The compound having the structure:

has a refined leathery and castoreum aroma profile. The 4(2'-butyl) phenyl acetate having the structure:

may be prepared from the corresponding phenol having the structure:

by acetylation thereof under standard esterification conditions using acetic anhydride according to the reaction:

50 The reaction preferably takes place at reflux conditions in the presence of an inert solvent such as toluene. At the end of the reaction the reaction mass is neutralized and the reaction product is distilled at a temperature in the range of 75-79°C. and 0.8-2 psi (absolute).

The compound having the structure:

is a known compound disclosed at Chemical Abstracts Volume 99, Monograph 139339e (abstract of Japanese Kokai Tokkyo Koho 58/94042; J. Am. Chem. Soc. 72, 1352-6 (1950); and Acta Chem. Scand. 5, 485-6 65 (1951).

40

45

50

55

60

65

The diethyl ester of 2-isopropyl-3-oxosuccinic acid may be prepared by reacting ethyl isovalerate having the structure:

5

with diethyl oxalate according to the reaction:

25 in the presence of an alkali metal alkoxide wherein M represents alkali metal such as sodium and potassium 25 and R represents alkyl such as methyl, ethyl and isopropyl. The diethyl ester of 2-isopropyl-3-oxosuccinic acid of our invention having the structure:

and the method for synthesizing same are well known in the prior art, set forth, supra.

The leather key fragrance mixture of our invention and one or more auxiliary perfume ingredients including, for example, alcohols (other than the phenols of the leather key fragrance mixture of our 40 invention), aldehydes, ketones (other than the ketones of our invention), terpinic hydrocarbons, nitriles, esters (other than the esters of our invention), lactones, natural essential oils and synthetic essential oils, may be admixed so that the combined odors of the individual components produce a pleasant and desired leathery fragrance, for example, those useful in causing leather-like textile materials to have an intense, long-lasting leather aroma, e.g. those described in U.S. Letters Patent 4,465,730 issued on August 14, 1984, 45 the specification for which is incorporated by reference herein.

Such perfume compositions usually contain (a) the main note or the "bouguet" or foundation stone of the composition; (b) modifiers which round off and accompany the main note; (c) fixatives which include odorous substances which lend a particular note to the perfume throughout all stages of evaporation and substances which retard evaporation; and (d) topnotes which are usually low boiling fresh smelling

In perfume compositions, it is the individual components which contribute to their particular olfactory characteristics, however, the overall sensory effect of the perfume composition will be at least the sum total of the effects of each of the ingredients. Thus, the leather key fragrance mixture of our invention can be used to alter, modify or enhance the leather aroma characteristics of a perfume composition, for example, by 55 utilizing or moderating the olfactory reaction contributed by another ingredient in the composition.

The amount of the leather key fragrance mixture of our invention which will be effective in leathery perfume compositions as well as in leathery perfumed articles and leathery colognes depends on many factors including the other ingredients, their amounts and the effects which are desired. It has been found that leathery perfume compositions containing as little as 0.1% of the leather key fragrance mixture of our 60 invention can be used to impart, augment or enhanced leathery aromas with spicy, ambery, caryophyllenelike, animalic, tonquin-musk-like, sweet, vanilla-like, coconut, woody, orris, thyme-like, floral, fruity, β-ionone-like undertones with spicy and smooth leathery, oriental and sweet topnotes to soaps, cosmetics, polymers and other products. The amount employed can range up to 100% of the fragrance components and will depend on considerations of cost, nature of the end product, the effect desired on the finished product 65 and the particular fragrance sought.

10

15

20

25

30

35

50

55

60

The leather key fragrance mixture of our invention is useful (taken alone or together with other ingredients in perfume compositions) as (an) olfactory component(s) in detergents and soaps, space odorants and deodorants, perfumes, colognes, toilet water, bath preparations such as creams, deodorants, hand lotions and sun screens, powders such as talcs, dusting powders, face powders and the like. When used as (an) olfactory component(s) as little as 0.1% of the leather key fragrance mixture of our invention will suffice to impart an intense leathery note to perfume formulations including woody and rose formulations but also including leather formulations: Generally, no more than 5% of the leather key fragrance mixture of our invention based on the ultimate end product is required in the perfumed article. Accordingly, the perfumed article of our invention may contain from about 0.1% up to about 5% by weight of the perfumed article.

In addition, the perfume composition or fragrance composition of our invention can contain a vehicle or carrier for the leather key fragrance mixture of our invention. The vehicle can be a liquid such as an alcohol, a non-toxic glycol or the like. The carrier can also be an absorbent solid such as gum (e.g., gum arabic, guar gum or xanthan gum) or components for encapsulating the composition (such as gelating when encapsulating by means of coacervation or such as a urea formaldehyde prepolymer when encapsulating

The leather key fragrance mixture of our invention may be blended into polymers when forming a perfumed polymer by means of extrusion using a single or double screw extruder or techniques such as that set forth in U.S. Letters Patent 4,427,498 issued on January 27, 1981, the disclosure of which is incorporated by reference herein, which discloses microporous polymers which are capable of containing volatile substances such as perfumes and the like and forms ranging from films to blocks and intricate shapes from synthetic thermoplastic polymers such as olefinic condensation or oxidation polymers.

Other techniques of blending the leather key fragrance mixture of our invention with polymers are exemplified in U.S. Letters Patent 3,505,423 (the specification for which is incorporated by reference herein) which discloses a method for scenting a polyolefin with such materials as the leather key fragrance mixture of our invention which comprises:

(a) mixing a first amount of the liquid polyolefin (e.g., polyethylene or polypropylene) with a relatively large amount of leather scent-imparting material (in this case the leather key fragrance mixture of our invention) to form a flowable mass;

(b) forming drops of said mass and causing substantially instantaneous solidification of said drops into
 30 polyolefin pellets having a relatively large amount of such scent-imparting materials as the leather key
 fragrance mixture of our invention imprisoned therein;

(c) melting said pellets with a second amount of polyolefin and said second amount being larger than the first amount; and

(d) solidifying the melt of (c).

The following Examples I, II and III set forth methods for ascertainment of actual natural components in leather aroma existing in natural leathers or in the head space above the natural leathers (Example III). Examples IV and V set forth syntheses for the products having the structures:

Examples following Example V, that is Examples VI, et seq, set forth examples indicating organoleptic utilities of the leather key fragrance mixture of our invention.

It will be understood that these examples are illustrative and that the invention is not to be restricted thereto except as indicated in the appended claims.

Example I

Chemical extraction of vegetable tanned leather

330 Grams of sliced leather pieces (measuring approximately 1" × 1/2") are placed in a large Soxhlet extractor and extracted with 3 liters of diethyl ether. The ether extracted leather is then re-extracted with 3 liters of FREON[®] 11 for eight hours. After removal of solvent from the first extract, 8.5 grams of a crude extract results. After removal of the FREON[®] 11. no extract results.

20

25

The extract is then distilled on a short path micro distillation column to yield four fractions as follows:

| 5 | Fraction no. | Vapor temp. (°C.) | Liquid temp. (°C.) | Vacuum mm/Hg. | Weight of fraction (grams) | 5 |
|----|------------------|-----------------------------|------------------------------|------------------------------|-------------------------------------|----|
| 10 | 1 2 3 4 | 97/112 117 128 126 | 159/162 165 170 175 | 1.0/1.0 1.0 1.0 1.0 | 0.05 0.05 0.40 0.40 | 10 |

Figure 1 is the GLC profile of the crude extract prior to distillation (Conditions: SE-30 glass capillary 15 column, 50M × 0.032" programmed at 80-220°C. at 2" per minute).

The peak indicated by reference numeral 10 is the peak for n-octadecane.

The peak indicated by reference numeral 11 is the peak for n-heptadecane.

The peak indicated by reference numeral 12 is the peak for nonadecane.

The peak indicated by reference numeral 13 is the peak for n-eicosane.

The peak indicated by reference numeral 14 is the peak for methyl myristate.

The peak indicated by reference numeral 15 is the peak for methyl palmitate.

The peak indicated by reference numeral 16 is the peak for methyl stearate. The peak indicated by reference numeral 17 is the peak for methyl octadecenoate.

Figure 2 is the GLC profile for fraction 1 of the foregoing distillation (Conditions: $2.5' \times 0.125''$ 5%

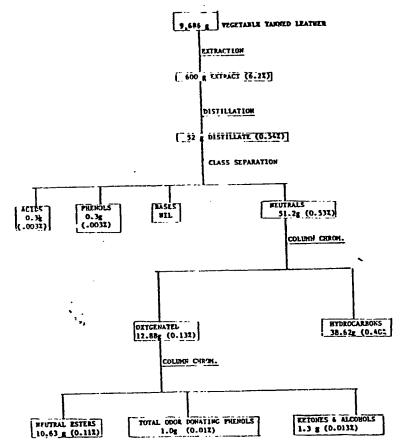

25 Carbowax column programmed at 100-200°C. at 6° per minute).

Figure 3 is the GLC profile for fraction 2 of the foregoing distillation.

Figure 4 is the GLC profile for fraction 3 of the foregoing distillation.

Figure 5 is the GLC profile for fraction 4 of the foregoing distillation.

The standard analytical technique for analyzing the extract is set forth in the following diagram:

Example II

26 gms of combined leather fractions

Dissolve in 200 ml

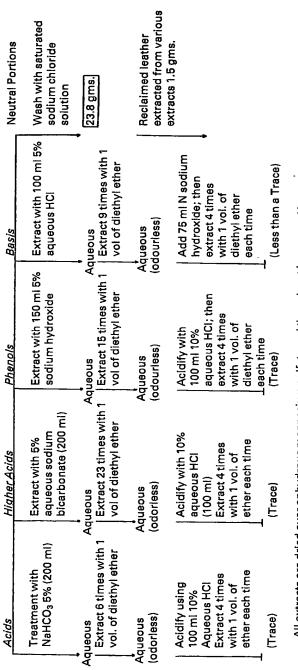

diethyl ether

Analysis of vegetable-tanned leather

52.1 Grams of leather extract distillate is prepared by the same procedure as Example I (117-128°C. at 1.0 mm/Hg. pressure boiling point).

Half of this material was then subjected to class separation using techniques known in the art as follows:

5

All extracts are dried over anhydrous magnesium sulfate and the solvent is removed by room

temperature rotary vacuum evaporation.

The resulting odor evaluation is as follows:

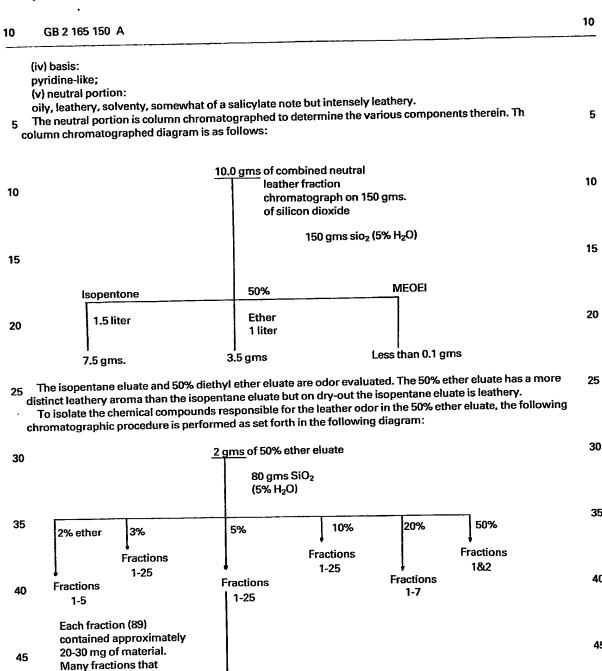

(i) lower acids:

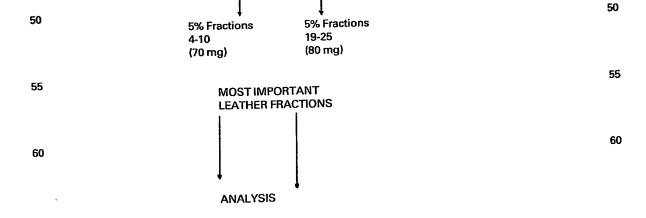

phenyl acetic acid-like, animal-like, green, slightly leathery;

(ii) higher acids:

some leather character; has some sweet benzoin and is vanilla-like; (iii) phenols:

phenolic birch-tar, and clove terpene-like;

were analytically the same were combined.

Bulked fractions 3-9 have excellent, long-lasting leathery and ylang aroma nuances with sweet, floral topnotes.

Example V

40

Preparation of diethyl ester of 2-isopropyl-3-oxosuccinic acid Reaction:

25
30
MOR
35

(wherein M represents sodium and R represents ethyl).

Into a 2 liter three necked reaction flask equipped with stirrer, thermometer, condenser, addition funnel and nitrogen inlet tube is placed 800ml anhydrous toluene and 41 grams of sodium ethoxide. Over a period 45 of 30 minutes from the addition funnel a mixture of 73 grams diethyl oxalate (0.5 moles) and 65 grams of ethyl valerate (0.5 moles) is added to the reaction mass while maintaining the reaction temperature at 35°C. At the end of the addition period, the reaction mass is heated to 50°C, and maintained at 50°C, with stirring for a period of 10 hours. At the end of the 10 hour the reaction mass is cooled to room temperature and 300ml water is added. The pH is adjusted to 6 using 5% aqueous hydrochloric acid (70ml).

The organic phase is separated from the aqueous phase and the organic phase is washed with 400ml water and then dried over anhydrous sodium sulphate. The organic phase is then concentrated on a rotary evaporator to 30 grams. The resulting product is distilled at 80°C, and 0.7 mm/Hg yielding the diethyl ester of 2-isopropyl-3-oxosuccinic acid having the structure:

55 60 60

Figure 8 is the GLC profile for the crude reaction product prior to distillation (Conditions: 50M × 0.23M fused silica capillary column coated with carbowax 20M programmed at 50-225°C. at 2°C. per minute).

Example XII

Utilizing the procedure of Example I at column 15 of U.S. Letters Patent 3,632,396 (the disclosure of which is incorporated by reference), nonwoven cloth substrates useful as drier added fabric softening articles of manufacture are prepared wherein the substrate, the substrate coating, the outer coating and the perfuming 5 material are as follows:

- 1. A water "dissolvable" paper ("Dissolvo Paper");
- 2. Adogen 448 (m.p. about 40°F.) as the substrate coating; and
- 3. An outer coating having the following formulation (m.p. about 150°F):

57% C₂₀₋₂₂ HAPS

22% isopropyl agent 10

20% antistatic agent

1% of one of the substances as set forth in Table II of Example VII.

Fabric softening compositions prepared according to Example I at column 15 of U.S. Letters Patent 3,632,396 having aroma characteristics as set forth in Table II of Example VII, supra, consist of a substrate 15 coating having a weight of about 3 grams per 100 square inches of substrate; a first coating located directly on the substrate coating consisting of about 1.85 grams per 100 square inches of substrate; and an outer coating coated on the first coating consisting of about 1.4 grams per 100 square inches of substrate. One of the substances of Table II of Example VII is admixed in each case with the outer coating mixture, thereby providing a total aromatized outer coating weight ratio to substrate of about 0.51:1 by weight of the 20 substrate. The aroma characteristics are imparted in a pleasant manner to the head space in a drier on operation thereof in each case using said drier-added fabric softener nonwoven fabrics and these aroma

characteristics are described in Table II of Example VII, supra.

Example XIII

30

25 Hair spray formulations

The following hair spray formulation is prepared by first dissolving PVP/VA E-735 copolymer manufactured by the GAF Corporation of 140 West 51st Street, New York, New York, in 91.62 grams of 95% food grade ethanol. 8.0 Grams of the copolymer is dissolved in the alcohol. The following ingredients are added to the PVP/VA alcoholic solution:

Ingredients Weight percent Dioctyl sebacate 0.05% Benzyl alcohol 35 0.10% 35 Dow Corning 473 fluid (prepared by the Dow Corning Corporation)..... 0.10% Tween 20 surfactant (prepared by ICI America 40 40 Corporation)..... 0.03% One of the perfumery substances as set forth in Table II of Example VII..... 0.10%

The perfuming substances as set forth in Table II of Example VII add aroma characteristics as set forth in Table II of Example VII which are rather intense and aesthetically pleasing to the users of the soft-feel, good-hold pump hair sprays.

Example XIV

50 Conditioning Shampoos

Monamid CMA (prepared by the Mona Industries Company (3.0 weight percent) is melted with 2.0 weight percent coconut fatty acid (prepared by Procter & Gamble Company of Cincinnati, Ohio); 1.0 weight percent ethylene glycol disterate (prepared by the Armak Corporation) and triethanolamine (a product of Union Carbide Corporation) (1.4 weight percent). The resulting melt is admixed with Stepanol WAT produced by 55 the Stepan Chemical Company (35.0 weight percent). The resulting mixture is heated to 60°C. and mixed until a clear solution is obtained (at 60°C.) This material is "Composition A".

Gafquat® 755 N polymer (manufactured by GAF Corporation of 140 West 51st Street, New York, New York) (5.0 weight percent) is admixed with 0.1 weight percent sodium sulfite and 1.4 weight percent polyethylene alvcol 6000 distearate produced by Armak Corporation. This material is "Composition B".

The resulting "Composition A" and "Composition B" are then mixed in a 50:50 weight ratio of A:B and cooled to 45°C. and 0.3 weight percent of perfuming substance as set forth in Table II of Example VII is added to the mixture. The resulting mixture is cooled to 40°C. and blending is carried out for an additional one hour in each case. At the end of this blending period, the resulting material has a pleasant fragrance as indicated in Table II of Example VII.

Referring to the drawings in Figures 11 and 12, the invention embodied therein comprises a device for

65

10

15

20

25

30

35

40

45

50

55

forming leather-scented polymer pellets (e.g., polyethylene, polypropylene or mixture of polyepsiloncaprolactone and polyethylene or polypropylene or copolymers of polyvinyl acetate and polyethylene or the like) which comprises a vat or container 210 into which the leather key fragrance mixture is placed.

The container is closed by an air-tight lid 228 clamped to the container by clamps 265. A stirrer 273 5 traverses the lid or cover 228 in an air-tight manner and is rotated in a suitable manner. The surrounding cylinder 212 having heating coils which are supplied with electrical current through cable 214 from a rheostat or control 216 is operated to maintain the temperature inside the container 210 such that the polymer such as polyethylene in the container will be maintained at a molten or liquid state. It has been found advantageous to employ a colorless, odorless polymer such as low density polyethylene with a viscosity ranging between 10 180 and 220 centistokes and having a melting point in the neighborhood of 220°F. The heater 212 is operated to maintain the upper portion of the container 210 within the temperature range of from 250-350°F.

In accordance with this aspect of the invention, a polymer such as polyethylene or polypropylene is added to the container 210 and is then heated from 10 to 12 hours whereafter a leather scent or aroma imparting material containing the leather key fragrance mixture is quickly added to the melt. The material must be 15 compatible with the polymer and forms a homogeneous liquid melt therewith. The heat resisting mixture generally containing about 10-40% by weight of the leather key fragrance mixture is added to the polymer.

After the leather key fragrance mixture is added to container 210 the mixture is stirred for a few minutes, for example 5-15 minutes, and maintained within the temperature range as indicated previously by the heating coils 212, and 128, respectively. The controls 216 and 220 are connected through cables 224 and 226 20 through a suitable supply of electric current for supplying the power for heating purposes.

Thereafter, the valve "V" is opened permitting the mass to flow outwardly through a conduit 232 having a multiplicity of orifices 234 adjacent the lower side thereof. The outer end of the conduit 232 is closed so that the liquid polymer and the leather key fragrance mixture will continuously drop through orifices 234 downwardly from the conduit 232. During this time, the temperature of the polymer and a leather key

25 fragrance mixture in the container 210 is accurately controlled so that a temperature in the range of from 210 up to 275°F. will be maintained in the material exiting in the conduit 232. The regulation of the temperature through the control 216 and the control 220 is essential in order to insure temperature balance to provide for the continuous dropping or dripping of the molten polymer and the leather key fragrance mixture through the orifices 234 at a range which will insure the formation of droplets 236 which will fall downwardly onto a 30 moving conveyor belt 238 trained to run between conveyor wheels 240 and 242 beneath the conduit 232.

When the droplets 236 fall onto the conveyor belt 238 they form pellets 244 which harden almost instantaneously and fall off the end of the conveyor 238 into a container 246 which is advantageously filled with water or some other suitable liquid to insure the rapid cooling of each of the pellets. The pellets are then collected from the container 246 and packaged for shipment.

A feature of the invention is the provision for moistening the conveyor belt 238 to insure the rapid formation of the solid polymer-leather scented pellets 244 without sticking to the belt. The belt 238 is advantageously of a material which will not normally stick to a melted polymer but the moistening means 248 insures a sufficiently cold temperature of the belt surface for the adequate formation of the pellets 244. The moistening means comprises a container 250 which is continuously fed with water 252 to maintain a 40 level 254 for moistening a sponge element 256 which bears against the exterior surface of the belt 238.

Example XV

Scented polyethylene pellets having a pronounced scent as set forth in Table II of Example VII are prepared

75 Pounds of polyethylene of a melting point of about 200°F. are heated to about 230°F. in a container of the kind illustrated in Figures 11 and 12. 25 Pounds of each of the perfume materials of Table II of Example VII, supra, are then added quickly to the liquified polyethylene. The lid 228 is put in place and the agitating means 273 are actuated. The temperature is maintained at about 225F. and the mixing is then continued for about 5-15 minutes. The valve "V" is then opened to allow flow of the molten polyethylene enriched with 50 each of the aroma substance-containing materials to exit through the orifices 234. The liquid falling through the orifices 234 solidify almost instantaneously upon impact with the moving, cooled conveyor 238. Solid polyethylene beads or pellets 244 having pronounced aromas as set forth in Table II of Example VII, supra,

are then formed. Analysis demonstrates that the pellets contain about 25% of each of the perfume substances of Table II of Example VII so that almost no losses of the scenting substance occur. These pellets 55 may be called master pellets. 50 Pounds of the scent-containing master pellets are then added to 1,000 pounds of unscented polyethylene powder and the mass is heated to the liquid state. The liquid is molded into thin sheets of films. The sheets or films have a pronounced aroma as set forth in Table II of Example VII, supra. The sheets are

also fabricated into garbage bags which have aromas as set forth in Table II of Example VII, supra.

CLAIMS

1. A mixture of chemicals having a pronounced leathery aroma consisting essentially of: "A": At least one substance having the structure:

5

10 in an amount of from about 1% up to about 5% wherein R₉ represents C₉-C₁₁ straight-chain alkyl and wherein R¹⁰ represents methyl and X is a moiety selected from the group consisting of:

10

5

15

and

15

"B": At least one compound having the structure:

20

25

$$R_{15}$$
 R_{14}
 R_{13}
 R_{14}

in an amount of from about 3 up to about 7% wherein each of R_{12} - R_{15} represents hydrogen or C_1 - C_4 alkyl with 30 the proviso that at least two of R_{12} - R_{15} represents hydrogen;

"C": At least one compound having the structure:

30

35

40

45

50

60

35

40 in an amount of from about 2% up to about 6% wherein R₁, R₂, R₃, R₄ and R₅ each represents hydrogen or C₁-C₄ alkyl with the proviso that one, two or three of R₁, R₂, R₃, R₄ and R₅ represents C₁-C₄ alkyl;

"D":Optionally, at least one compound having the structure:

45

50 in an amount of from 0% up to about 1.2% wherein R_6 represents hydrogen or methyl and R_{11} represents

hydrogen or methyl with the proviso that at least one of R_6 or R_{11} is hydrogen; "E": At least one compound defined according to the structure:

55

in an amount of from about 30% up to about 70% wherein R, represents C_{11} , C_{13} , or C_{15} , straight-chain alkyl and R_8 represents C_1 - C_3 lower alkyl;

"F": At least one compound having the structure:

5

in an amount of from about 20% up to about 60 wherein n represents an integer of from 8 up to 28; "G": Optionally, the compound having the structure:

10

5

15

10

15

20

in an amount of from 0 up to about 6%; and

"H": Optionally, the compound having the structure:

20

25

25

30

30

in an amount of from 0 up to about 6% with requirement that:

equal 100%.

2. A process for augmenting or enhancing the aroma of a consumable material selected from the group consisting of perfume compositions, perfumed polymers, colognes and perfumed articles comprising the 40 step of adding to said consumable material an aroma augmenting or enhancing quantity of the composition of matter defined according to claim 1.

40

- The process of claim 2, wherein the consumable material is a perfume composition.
- The process of claim 2, wherein the consumable material is a cologne.
- The process of claim 2, wherein the consumable material is perfumed article.
- 6. The process of claim 2, wherein the consumable material is a perfumed article and the perfumed article is a solid or liquid anionic, cationic, nonionic or zwitterionic detergent.

45

- 7. The process of claim 2, wherein the consumable material is a perfumed article and the perfumed article is a fabric softener composition or fabric softener article.
- 8. The process of claim 2, wherein the consumable material is a perfumed article and the perfumed 50 article is a hair preparation.

50

55

- 9. The process of claim 2, wherein the consumable material is a perfumed polymer and the perfumed
 - article is a synthetic leather polymer. 10. A process for preparing a mixture having a leathery aroma substantially as hereinbefore described in
- Examples VI. 11. A mixture of chemicals having a leathery aroma whenever obtained by the process of claim 10.
 - 12. A process for preparing perfumed materials substantially as hereinbefore described in any one of Examples VII-XV.
 - 13. A perfumed article whenever obtained by the process of claim 12.
